[0002] This application relates to the co-pending and commonly assigned patent application Serial No. ~~10/681,934~~ entitled "Multilayered Oscillating Device with Spine Support," (Attorney Docket TI-36490) filed concurrently herewith, which application is hereby incorporated herein by reference.

TECHNICAL FIELD

[0003] The present invention relates generally to rapidly moving functional surfaces, such as mirrors, and "scanning mirrors." More specifically, the invention relates to multilayered MEMS (micro-electric mechanical systems) torsional hinge functional surfaces, such as mirrors, operating at the resonance frequency of the device. A hinge layer having a first set of torsional hinges for providing the back and forth pivoting at a controlled frequency about a first axis includes an attaching member with a front side and a back side. A functional surface layer, such as a mirror, having a reflective surface is bonded or mounted to the front side of the hinge layer, and a back layer having a mass moment equal to the mass moment of the functional surface layer is bonded or mounted to the back side of the hinge layer. According to one embodiment, the mass moment of the front layer is the mass of the front layer times the distance or offset of the center of the mass of the front layer from the first axis and the mass moment of the back layer is
